Problem Statement

Many job portals still don't have any AI auto-form completion; even if they do, they fail on resumes made with templates. This causes job applicants to fill out and correct the forms, creating a time-consuming activity.

Proposed Solution

Create an OCR-based AI model, trained on multiple templates from the internet that can parse resumes and fill out information like Name, Email Addresses, and Phone Numbers.

Auto Filler

This project is dedicated to creating an OCR software that recognizes text and patterns on resumes and CVs to auto-complete application forms. It is found that many job applicants bounce off job portals with manual forms, so to address this problem we will parse out their resumes.
